Attention First, page 72 — Prompts 32–33

CIT 140 · Week 3 · Stakeholder Map
Section Seven: Designing Your Teams, Tools, and Human-AI World

Prompt 32: Tool and Template Inventory

Stakeholder map: Helps the team identify who is affected, who contributes information, who makes decisions, and which responsibilities still need confirmation.

Interview guide: Keeps conversations organized while allowing each stakeholder to explain their experience, needs, and concerns.

Workflow observation checklist: Helps the team verify how QA checks and exceptions are actually handled on the night shift instead of relying only on assumptions.

Decision and responsibility register: Tracks the named authorizing sponsor, record custodian, approval limits, and unanswered questions without assuming someone has authority.

Consultation schedule: Helps arrange daytime and night-shift input so the review includes people who perform the work and does not overlook shift-specific needs.

Prompt 33: Identity-Building Questions

1. What experience, knowledge, or responsibility do you bring that others may not see?
2. What do you need from this review to do your work accurately and effectively?
3. What part of the current workflow should the team observe or verify before making a recommendation?

Connection to the Stakeholder Map

These tools make the consultation plan more practical by separating people's roles, evidence, and decision authority. The interview questions invite stakeholders to explain what they know and contribute instead of assuming their answers. They also help identify missing voices, including a night-shift operator, and clarify the record custodian's and authorizing sponsor's responsibilities before detailed requirements are gathered.

Typed response to the assigned prompts. Confirm that this typed format is accepted for the course's book-evidence requirement before treating it as approved evidence.
